

PYTHON CASE STUDY

1. ATM Simulation System:

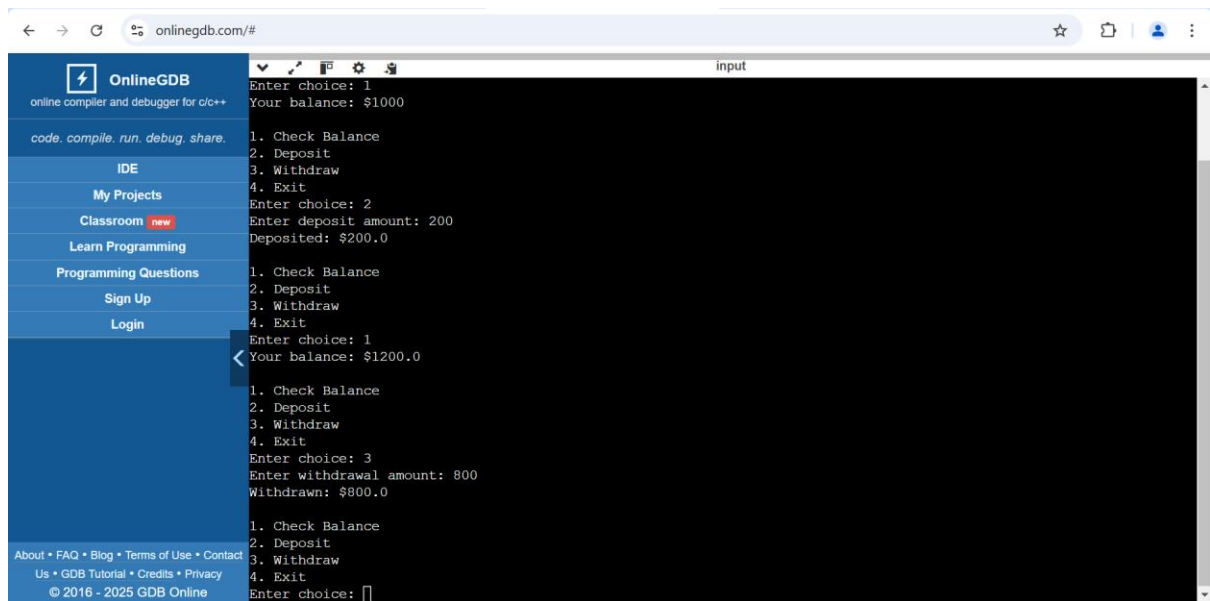

CODE:

```
class ATM:
    def __init__(self, balance=1000):
        self.balance = balance
    def check_balance(self):
        print(f"Your balance: ${self.balance}")
    def deposit(self, amount):
        self.balance += amount
        print(f"Deposited: ${amount}")
    def withdraw(self, amount):
        if amount > self.balance:
            print("Insufficient funds!")
        else:
            self.balance -= amount
            print(f"Withdrawn: ${amount}")

def main():
    atm = ATM()
    while True:
        print("\n1. Check Balance\n2. Deposit\n3. Withdraw\n4. Exit")
        choice = input("Enter choice: ")
        if choice == "1":
            atm.check_balance()
        elif choice == "2":
            amt = float(input("Enter deposit amount: "))
            atm.deposit(amt)
        elif choice == "3":
            amt = float(input("Enter withdrawal amount: "))
            atm.withdraw(amt)
        elif choice == "4":
            print("Thank you for using the ATM!")
            break
        else:
            print("Invalid choice! Try again.")

main()
```

Output:

2. E-Commerce Order Management:

CODE:

```
class Product:
    def __init__(self, name, price):
        self.name = name
        self.price = price

class ShoppingCart:
    def __init__(self):
        self.cart = []

    def add_product(self, product):
        self.cart.append(product)
        print(f"{product.name} added to cart!")

    def view_cart(self):
        if not self.cart:
            print("Cart is empty!")
        else:

        if choice in products:
            cart.add_product(products[choice])
        elif choice == "4":
            cart.view_cart()
        elif choice == "5":
            cart.checkout()
            break
        elif choice == "6":
            print("Thank you for shopping!")
            break
        else:
            print("Invalid choice!")

main()

```

OUTPUT:

The screenshot shows the OnlineGDB web interface. The browser address bar displays 'onlinegdb.com/#'. The sidebar on the left contains the following links: OnlineGDB, online compiler and debugger for c/c++, code, compile, run, debug, share, IDE, My Projects, Classroom (new), Learn Programming, Programming Questions, Sign Up, and Login. The main area features a code editor with the Python code from the previous block. Below the editor is an output console showing the program's execution. The console output is as follows:

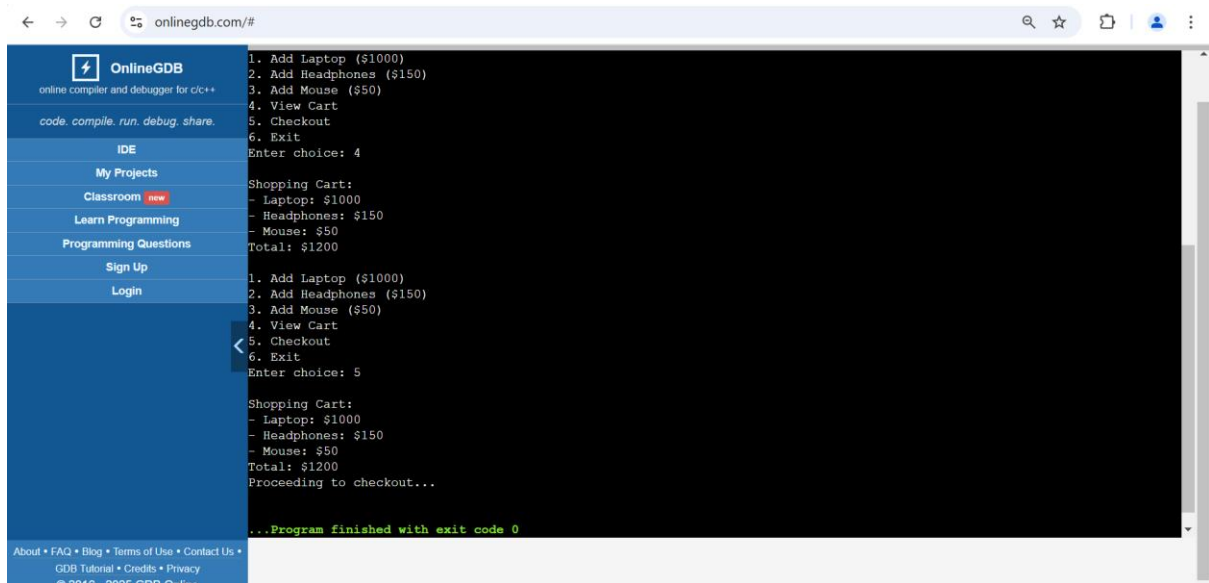

```

1. Add Laptop ($1000)
2. Add Headphones ($150)
3. Add Mouse ($50)
4. View Cart
5. Checkout
6. Exit
Enter choice: 1
Laptop added to cart!

1. Add Laptop ($1000)
2. Add Headphones ($150)
3. Add Mouse ($50)
4. View Cart
5. Checkout
6. Exit
Enter choice: 2
Headphones added to cart!

1. Add Laptop ($1000)
2. Add Headphones ($150)
3. Add Mouse ($50)
4. View Cart
5. Checkout
6. Exit
Enter choice: 3
Mouse added to cart!

```

3. Student Grade Management System:

CODE:

```
class GradeSystem:
    def __init__(self):
        self.grades = {}
    def add_grade(self, name, grade):
        self.grades[name] = grade
        print(f"Added: {name} - {grade}")
    def view_grades(self):
        if not self.grades:
            print("No grades available!")
        else:
            print("\nStudent Grades:")
            for name, grade in self.grades.items():
                print(f"{name}: {grade}")
    def calculate_average(self):
        if not self.grades:
            print("No grades available!")
        else:
            avg = sum(self.grades.values()) / len(self.grades)
            print(f"Class Average: {avg:.2f}")
def main():
    system = GradeSystem()

    while True:
        print("\n1. Add Grade\n2. View Grades\n3. Calculate Average\n4.Exit")
```

```

    choice = input("Enter choice: ")
